

# WHEN SEX IS A CRIME AND SPIT IS A DANGEROUS WEAPON

## A SNAPSHOT OF HIV CRIMINALIZATION IN THE UNITED STATES

A 23-year old Oregon man was sentenced to 87 months in prison after pleading guilty to unprotected sex without disclosure of his HIV-positive status to a man he met on Manhunt.com.

A man with HIV in Michigan was charged under the state's anti-terrorism statute with possession of a "biological weapon" after an altercation with a neighbor. Prosecutors equated his HIV infection with "possession or use of a harmful device."

A man in New York was sentenced to 10 years for aggravated assault after biting a police officer.

A man with HIV in Iowa, who had an undetectable viral load, was sentenced to 25 years after a one-time sexual encounter during which he used a condom.

A man in Ohio is serving 40 years for failing to disclose to a girlfriend that he was positive. He claims she knew he was positive and only went to a prosecutor after he stopped dating her and moved in with another woman.

A man with HIV in Texas is serving 35 years for spitting at a police officer.

A woman in Georgia was sentenced to eight years for failing to disclose her HIV status, despite publication of her status on the front page of the local newspaper and testimony from two witnesses that her sexual partner was aware of her HIV-positive status.

**MORE THAN  
160  
PROSECUTIONS  
SINCE 2008\***

- HIV-SPECIFIC STATUTE, AT LEAST ONE PROSECUTION IN PAST TWO YEARS
- HIV-SPECIFIC STATUTE, NO RECENT REPORTED PROSECUTIONS
- HIV-RELATED PROSECUTIONS, THOUGH NO HIV-SPECIFIC STATUTE
- ⚠ FIVE OR MORE PROSECUTIONS IN THE LAST TWO YEARS

\*The total number of arrests and prosecutions from 2008-2013 reported here are illustrative, not a precise count. It is impossible to track all such arrests and prosecutions as there is no uniform system of monitoring and reporting them. The numbers represent those cases that are searchable in news and legal databases or that otherwise have come to the attention of the authors.

# WHEN SEX IS A CRIME AND SPIT IS A DANGEROUS WEAPON

## HIV CRIMINALIZATION HURTS PUBLIC HEALTH

Since the earliest days of the HIV/AIDS epidemic, stigma has been a major obstacle to accessing care and implementing effective HIV prevention policies.<sup>1</sup> People with HIV face pre-judgment, marginalization, discrimination and severe misunderstanding about the means and actual risk of transmission.<sup>2,3</sup>

Many people with HIV internalize and accept this judgment and the perception of those with HIV as toxic, highly infectious, or dangerous to be around. This has serious adverse ramifications for those individuals, as well as on the broader effort to combat HIV. Widespread ignorance about the actual routes and risks of transmission—and, in particular, the mistaken belief that transmission is likely to occur as the result of a single sexual exposure—is driving the arrest and severe sentencing of people with HIV in this country. In short, HIV-related stigma is both a serious public health problem and a pressing civil liberties issue.

Stigma discourages people at risk from accessing care<sup>4</sup>—including testing for HIV—and it discourages people who know they have HIV from disclosing that fact to potential sexual partners and others.<sup>5</sup> Nothing more powerfully drives stigma than when government sanctions it through discriminatory practices in the law or its application. This is reflected perhaps most dramatically in the criminal prosecutions of people with HIV who are unable to prove they disclosed their HIV-positive status to partners prior to sexual contact.<sup>6</sup>

The ostensible purpose of these statutes is to deter HIV-positive people from putting others at risk, but all available evidence shows that HIV criminalization does not serve its intended purpose. The inherent problem with these laws is that they focus primarily on the existence or lack of proof of disclosure (and on the health status of the person who has been tested for HIV), not on the nature of the exposure, the actual level of risk present, the intent of the person with the positive HIV test or even whether HIV was transmitted. Consequently, and as studies of the impact of these laws have demonstrated, they do nothing to advance their supposed goals.<sup>7</sup>

Our analysis is not able to capture fully whether defendants with HIV are given fair trials. In most cases, information about the baseline HIV status of the defendant's sexual partner or contacts is not available and proof of transmission to a sexual partner is generally not an element. In the reported cases involving situations in which a sexual partner actually tests positive for HIV, little if any information is provided about how the defendant, as opposed to another sexual partner, has been established as the source of infection.<sup>8</sup>

News and case reports also do not typically reveal whether the truthful testimony of defendants is given less weight because of the social stigma that attaches to the defendant's HIV status and the emotionally-charged allegations of betrayal within deeply intimate relationships. Nevertheless, given many of the "facts" as found by judges or juries in these cases, there is certainly support for the view that the testimony of defendants with HIV is often discounted. This is particularly true in cases where conflicting testimony is from from law enforcement personnel,<sup>9</sup> such as those testifying that

they were spit upon or bitten by an HIV-positive defendant in their custody, or from the "morally innocent" sexual partners whose trust has allegedly been betrayed by the nondisclosure of HIV status by a sexual partner.<sup>10</sup>

Defendants also may not have adequate access to expert scientific witnesses and defense counsel may be less than well-informed about the underlying medical and scientific issues.<sup>11</sup> Indeed, some convictions of persons with HIV appear to be the result of so-called expert testimony that is nothing more than "junk science." Even in cases where the defendant has well-informed and zealous counsel that seeks to challenge and discredit these so-called experts, judges and juries are often swayed by such inaccurate testimony because it comports with their own preconceived misconceptions about HIV transmission.

### EMPIRICAL STUDIES DEMONSTRATE THE NEGATIVE IMPACT OF HIV CRIMINALIZATION LAWS

1. There is no evidence that criminalization laws deter risky behavior.<sup>12</sup>
2. Studies have found no differences in risky sexual behavior between residents living in a state with a specific disclosure law compared to residents living in a state without such a law.<sup>13</sup>
3. Even when people are aware that an HIV-specific law exists in a particular state, they usually do not understand how the law functions (e.g., types of sexual behavior/activity requiring disclosure, penalty for non-disclosure, etc.).<sup>14</sup>
4. Criminalization sends the inaccurate message that attempting to avoid sexual partners with HIV is an adequate prevention strategy.
5. HIV criminalization laws weaken the message that sexual health is the responsibility of both partners during sex and increase stigma by strengthening the culture of blame surrounding infection.<sup>15</sup>
6. Treatment reduces transmission risk through all routes to near-zero.<sup>16</sup>
7. HIV criminalization is based on and reinforces grossly inaccurate perceptions of the actual routes and relative risks of HIV transmission.<sup>17</sup>
